

LESSON #9: SOLVING HIGHER-DEGREE POLYNOMIAL EQUATIONS WITH COMPLEX ROOTS (DAY 2)

1) Consider the polynomial equation $p(x) = x^3 + 3x^2 + x - 5$.

- a) How many real solutions does this equation have? 3
- b) How many complex solutions does this equation have? 2 (only hits x-axis 1x)
- c) What is the real solution to this equation? 1
- d) What linear factor does this solution come from? (x-1)
- e) How can we use that linear factor to solve for the other solutions? DIVIDE (LONG DIVISION)
- f) Solve for the complex solutions.

① Divide

$$\begin{array}{r}
 x^2 + 4x + 5 \\
 x-1 \overline{) x^3 + 3x^2 + x - 5} \\
 \underline{-x^3 + x^2} \\
 4x^2 + x \\
 \underline{-4x^2 + 4x} \\
 5x - 5 \\
 \underline{-5x + 5} \\
 0
 \end{array}$$

② Factor

$$\begin{aligned}
 x^2 + 4x + 5 &= 0 \\
 &\quad -5 \quad -5 \\
 \hline
 x^2 + \frac{4}{2}x + \boxed{4} &= -5 + \boxed{4} \\
 \sqrt{(x+2)^2} &= \sqrt{-1} \\
 x+2 &= \pm i \\
 \boxed{x = -2 \pm i}
 \end{aligned}$$

2) Find the solutions of $x^3 + 4x^2 + 8x + 8 = 0$ if $(x + 2)$ is a factor.

① Divide

$$\begin{array}{r}
 x^2 + 2x + 4 \\
 x + 2 \overline{) x^3 + 4x^2 + 8x + 8} \\
 \underline{-x^3 \oplus 2x^2} \\
 2x^2 + 8x \\
 \underline{-2x^2 \oplus 4x} \\
 4x + 8 \\
 \underline{-4x \oplus 8} \\
 0
 \end{array}$$

② Factor

$$\begin{aligned}
 x^2 + 2x + 4 &= 0 \\
 x^2 + 2x + 1 &= -4 + 1 \\
 \left(\frac{x}{2}\right)^2 + \left(\frac{x}{2}\right) + 1 &= -4 + 1 \\
 \sqrt{(x+1)^2} &= \sqrt{-3} \\
 x+1 &= \pm i\sqrt{3} \\
 -1 &\quad -1 \\
 \boxed{x = -1 \pm i\sqrt{3}}
 \end{aligned}$$

$$\{-2, -1 \pm i\sqrt{3}\}$$

Practice

3) Find the solutions of $5x^3 + 9x^2 - 13x + 15 = 0$ if -3 is a root. (Hint: What is the factor when $x = -3$ is a root?)

(x+3)

$$\begin{array}{r}
 5x^2 - 6x + 5 \\
 x + 3 \overline{) 5x^3 + 9x^2 - 13x + 15} \\
 \underline{-5x^3 \oplus 15x^2} \\
 -6x^2 - 13x \\
 \underline{+6x^2 + 18x} \\
 5x + 15 \\
 \underline{-5x \oplus 15} \\
 0
 \end{array}$$

$$\begin{aligned}
 5x^2 - 6x + 5 &= 0 \\
 a &= 5 & x &= \frac{-b \pm \sqrt{b^2 - 4ac}}{2a} \\
 b &= -6 & & \\
 c &= 5 & & \\
 & & x &= \frac{6 \pm \sqrt{-64}}{10} \\
 & & & \\
 & & x &= \frac{3 \pm 4i}{5}
 \end{aligned}$$

$$\left\{-3, \frac{3 \pm 4i}{5}\right\}$$

$$\boxed{x = \frac{3 \pm 4i}{5}}$$
